

# Waste becomes E-Fuel

10 billion tons of CO<sub>2</sub> are produced annually by burning petroleum.

An additional 2.5 billion tons of waste pollute the environment every year.

Three billion people suffer from pollution.

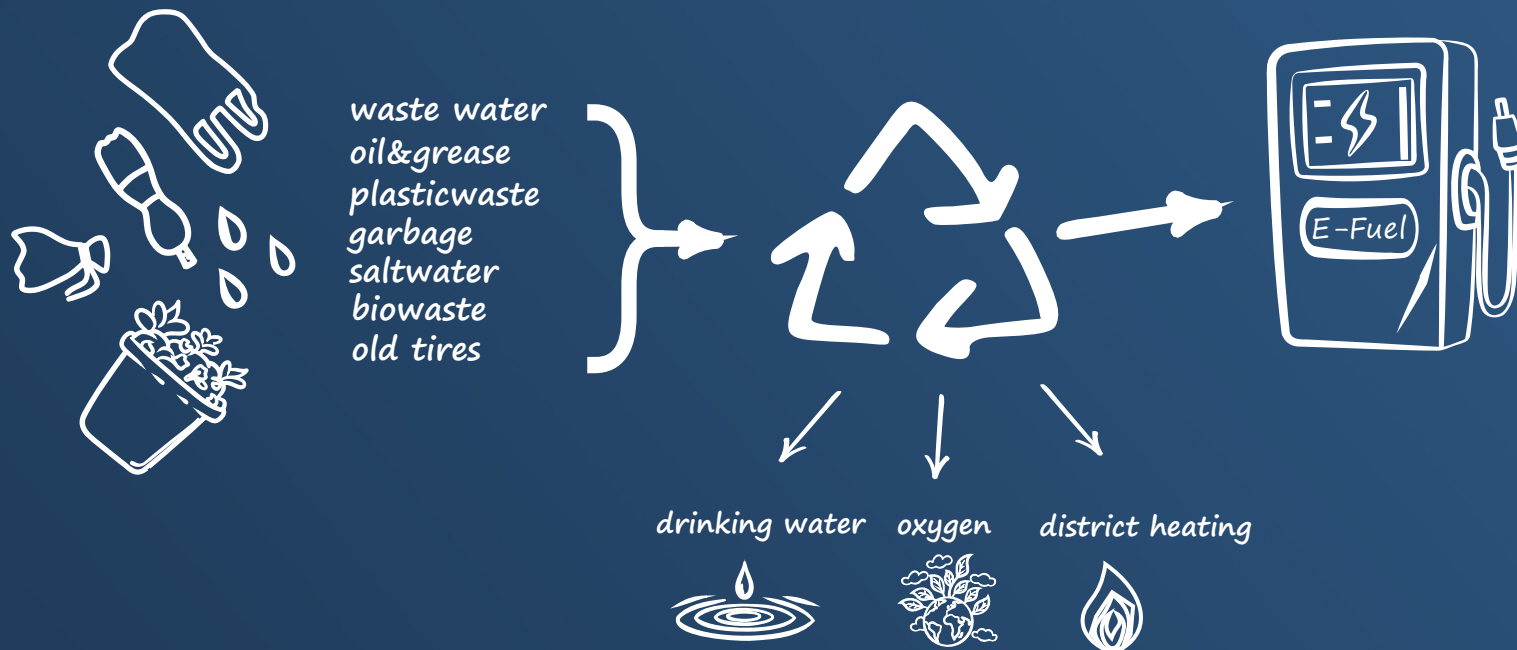

# What if waste could be turned into energy?

Everything in life is an energetic cycle. Even waste contains valuable energy. Energy that has been carelessly thrown away. Until now. Now comes Ecolyd 7.1. A machine that is changing our world. At least a little bit.

With Ecolyd 7.1, Zellstrom has developed a technology that turns waste into e-fuel. This reduces oil consumption, reduces plastic waste, saves massive amounts of CO<sub>2</sub>, and is also profitable. Exciting? Then read on.

# Introducing Ecolyd 7.1. The machine that converts waste into energy

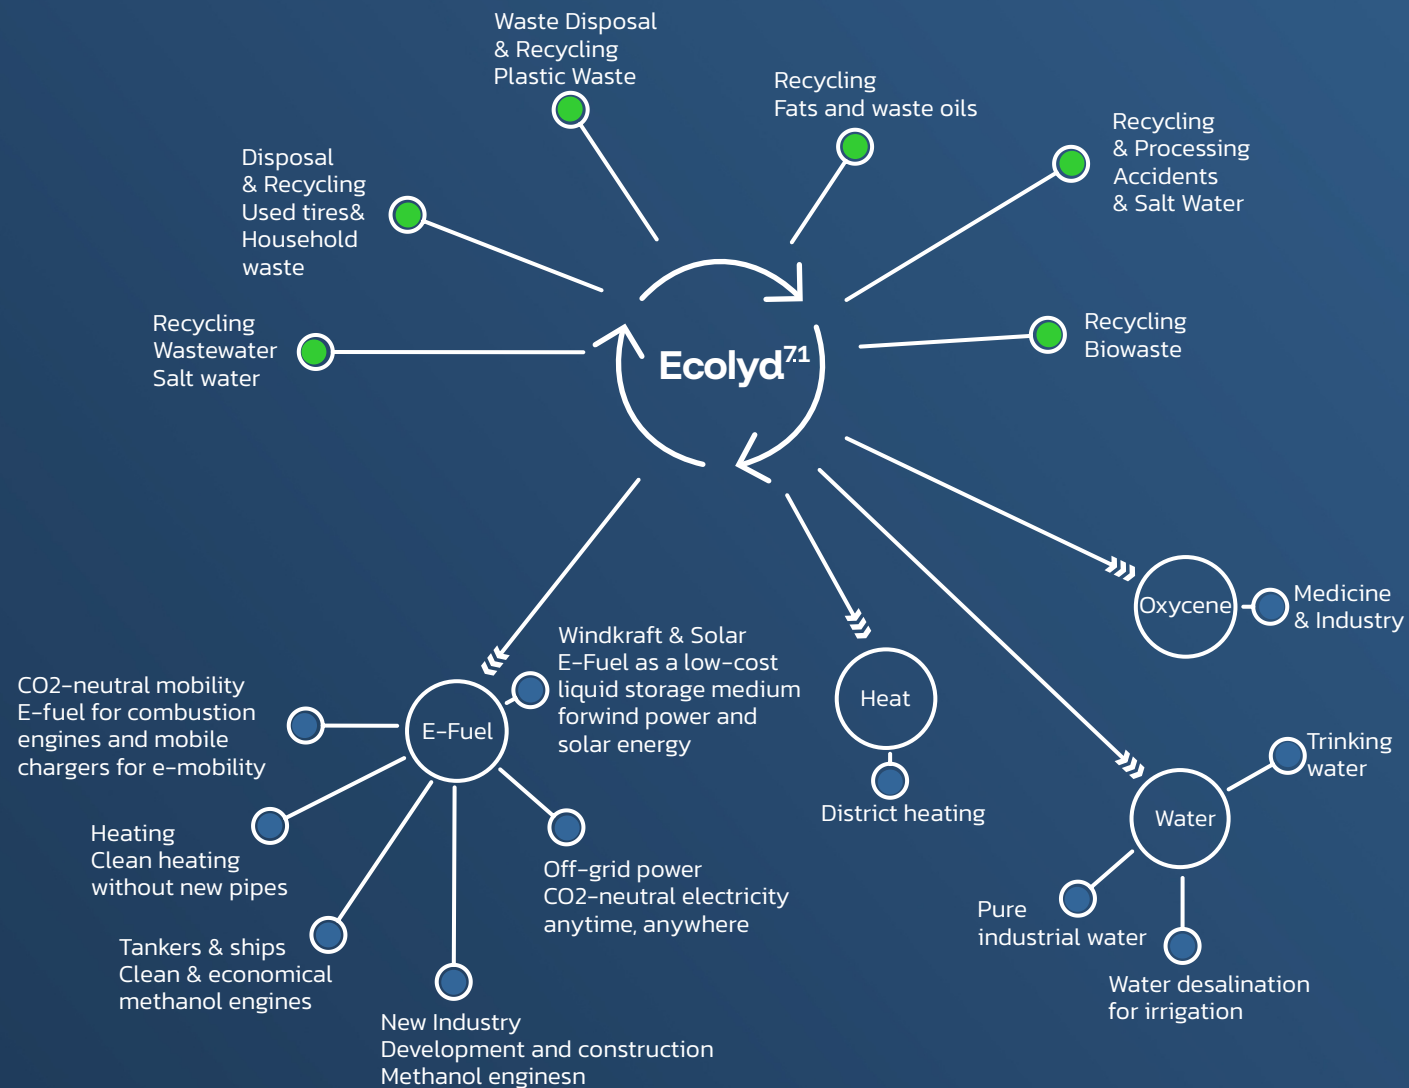

# Ecolyd 7.1 turns waste into e-fuel

Ecolyd 7.1 produces e-fuel from waste such as plastic waste, old tires, waste oil, organic waste, and wastewater via suspension plasmalysis. Oxygen and water are produced as by-products.

The container-based machine is easy to transport and scalable. Ecolyd 7.1 can be used anywhere “just in time” and is an innovative bridging technology on the way to a CO<sub>2</sub>-neutral world. With Ecolyd 7.1, environmental protection becomes practical and profitable.

# Ecolyd 7.1 is multifunctional

Ecolyd 7.1 makes environmental protection sexy and profitable. Really profitable. And it makes the world a little bit cleaner. For our children. And their children. Join in, it's worth it.
